

Striated Grasswren *Amytornis striatus* **Species No.: 513** **Band size: 03**

Morphometrics:

	Adult Male	Adult Female
Wing:	61 – 67 mm	60 – 66 mm
Tail:	81 – 97 mm	79 – 97 mm
Weight:	19.3 – 21.6 g	17 – 20.5 g

Ageing:

Juveniles are similar to adults but fluffier;
 Immatures are very similar to adults, but retain juvenile primaries, secondaries and tail, but these are only separable from adults if synchronous growth-bars can be detected;
 Breed throughout Spring and post-breeding season moult of adults occurs from November on;
 Immatures moult to full adult plumage at about 12 months old coinciding with the post-breeding season moult of adults;
 So birds identified as adults in Autumn, Winter and Spring will be at least (2+);
 Immatures will be either (1) or (2-).

Sexing :

Sexes not dimorphic on measurements;
 Adult birds can be separated by the colour of the flanks:

- Male flanks – vary from cream or buff to yellow-brown;
- Female flanks – rufous patch on anterior flanks.

Incubation is probably by female only.
