

White-faced Robin *Tregellasia leucops* **Species No.: 397** **Band size: 02 (01)**

Morphometrics:

| | Adult Male | Adult Female |
|------------|----------------|----------------|
| THL: | 32.8 - 36.1 mm | 32.1 – 34.2 mm |
| Wing: | 74 - 82 mm | 69 - 76 mm |
| Wing Span: | 235 – 253 mm | 214 – 234 mm |
| Tail: | 47 – 54 mm | 44 – 54 mm |
| Weight: | 13 – 18.3 g | 12.5 – 17-3 g |

Ageing:

- Most juvenile body feathers are moulted within 3 months of fledging;
- First immature is mostly as adult but with retained dark brown juvenile alula, greater primary coverts, remiges and rectrices. Retained tertials and secondaries have noticeable buff or light-brown suffusion to tips;
- Moults to adult plumage completed in second Summer coinciding with adult post-breeding season moult;
- Immatures are therefore either (1) or (2-);
- Adults are (2+).

Sexing :

Males are larger than females, but there is overlap in the ranges of all measurements, except in wing span: adult male > 235; adult female < 234;

Upper and lower ranges of other measurements will correctly sex the larger adult males and smallest adult females;

It is not known whether female alone incubates.
