Tarsus:	13.3 – 14.3 mm	14.1 – 15.0 mm
Weight:	no records	

**Ageing:**

Juveniles and immatures of *C.d. marshalli* and *C.d. macleayana* are duller than, but difficult to distinguish from adult females. Age all female plumaged birds of these subspecies as (1+); Adult male plumage is attained at approximately 14 months. Thus age all adult males of these two subspecies as (2+).

Female adults of *C.d. coxeni* are said to be slightly duller than males, but can not be reliably sexed on plumage. Therefore age all *coxeni* as (1+).

**Sexing:**
