

## SEXUAL DIMORPHISM IN THE BLUE BONNET

LEO JOSEPH

Angas Street. Kent Town, S.A. 5067

*Received 12 October, 1984*

A plumage character traditionally regarded as a subspecific character of the so-called Red-vented Blue Bonnet *Northiella haematogaster haematorrhous* actually occurs most prominently in males of eastern populations of *N. haematogaster*, i.e. generally, those east of 147°E. It is readily observable in the field.
