

RECOVERY ROUND-UP

This section is prepared with the co-operation of the Secretary, Australian Bird and Bat Banding Schemes, Australian National Parks and Wildlife Service. The recoveries are only a selection of the thousands received each year; they are not a complete list and should not be analysed in full or in part without the prior consent of the banders concerned. Longevity and distance records refer to the ABBBS unless otherwise stated. The distance is the shortest distance in kilometres along the direct line joining the place of banding and recovery; the compass direction refers to the same direct line. (There is no implication regarding the distance flown or the route followed by the bird).

Recovery or longevity items may be submitted directly to me whereupon their merits for inclusion will be considered.

Hon. Editor.

*Danish Banding Scheme.

Recovery Round-up Notes

The Little Penguin recoveries demonstrate how far immature birds move within a month of banding. The albatross recoveries demonstrate longevity and that of the Wandering Albatross is an interesting movement between two distant breeding locations. Fuller details of the recoveries from Heard Island were given by Woehler in *Corella* 13(2): 38-40. The Least Frigatebird recoveries are the first reported (see Stokes and Dunn, *Corella* 13(2): 62). The Australasian Gannet, boobies and Silver Gulls show distant movements. It is some time since an Arctic Tern has been reported, and it is interesting that yet another bird from Scandinavia has been recovered in Western Australia.
