

RECOVERY ROUND-UP

This section is prepared with the co-operation of the Secretary, Australian Bird-Banding Scheme, CSIRO Division of Wildlife and Rangelands Research. The recoveries are only a selection of the thousands received each year; they are not a complete list and should not be analysed in full or in part without the prior consent of the banders concerned. Longevity and distance records refer to the ABBS unless otherwise stated. The distance is the shortest distance in kilometres along the direct line joining the place of banding and recovery; the compass direction refers to the same direct line. (There is no implication regarding the distance flown or the route followed by the bird).

Recovery or longevity items may be submitted directly to me where-upon their merits for inclusion will be considered.

PLUMAGE

Little Eagle *Hieraaetus morphnoides*

The following preliminary data were obtained while observing Little Eagles at their nests since spring-summer 1980-81 at Armidale, N.S.W. (30°30'S., 151°40'E.). They are presented here because they add to, or are at variance with, the current literature.

Among light phase pairs, females had more extensive pale rufous smudging and heavier streaks on the underparts than their paler-breasted mates. No dark phase pairs were seen (dark birds had light phase mates),
