

Unusual Sightings of the Azure Kingfisher

D. KEAST

Sightings of the Azure Kingfisher *Ceyx azureus* have been made in the Darling Range area 30-40 km east of Perth, W.A. Sightings have occurred over late winter/early summer in 1973 and 1974 and in October and November of 1976. Should these observations be verified by others and the species be seen more regularly in future then the range for the Azure Kingfisher will be extended down the west coast of Australia as it is in the east.
